

# Pathway probabilities, total cost and time to treatment initiation for suspected TB patients

*Nathan Green*

*07/02/2020*

## Introduction

Posterior distributions are generated to provide DES model input parameters.

## Model

### Cost and time

Independent Bayesian linear regressions on cost and time to starting treatment with covariates of sputum smear results ('Not taken', 'Negative', 'Positive') and TB status (missing, 'E;PTB', 'PTB').

For individual  $i$ ,

$$c_i \sim N(\phi_i^c, \lambda); \quad t_i \sim N(\phi_i^t, \tau)$$

$$\phi_i^c = \mu_c + \gamma_{tb_i}^c + \beta_{ssm_i}^c; \quad \phi_i^t = \mu_t + \gamma_{tb_i}^t + \beta_{ssm_i}^t$$

We used uninformative priors. So, the posterior distribution of the expected cost and time are

$$\hat{\phi}_{tb,ssm}^c = \hat{\mu}_t + \hat{\gamma}_{tb}^c + \hat{\beta}_{ssm}^c; \quad \hat{\phi}_{tb,ssm}^t = \hat{\mu}_t + \hat{\gamma}_{tb}^t + \hat{\beta}_{ssm}^t.$$

### Pathway probabilities

Separate multinomial models were fit to counts of sputum smear microscopy results for pulmonary only ( $p$ ), and both pulmonary and extra-pulmonary ( $ep$ ) cases.

$$X_{ep} \sim Multi(p_{ep}, N_{ep}); \quad X_p \sim Multi(p_p, N_p)$$

The posterior distributions for  $p_{ep}, p_p$  are reported.

## Data

The IDEA dataset for Dosanjh category 1 and 2 patients only.

## Output

Posterior distributions and summary statistics for mean cost and time to starting treatment.

Not taken

## Negative

## Positive

**All smear results on same plot.**

Black - Not taken, Red - Negative, Blue - Positive.

**Time, E;PTB**

**Cost, E;PTB**

**Time, PTB**

**Cost, PTB**
